airbnb

Nicklas Thegerström
Emil Sjökvist
Fredrik Käll

Grupprojekt

DATASET: INSIDE AIRBNB, STOCKHOLM LISTINGS
4 955 LISTNINGAR, 79 KOLUMNER

MÅL: PREDICERA PRIS PER NATT OCH ANALYSERA VAD SOM DRIVER PRISET

Datarening och EDA

- Ladda data, inspektera, kör lite statistik för att börja bekanta oss med datasetet.

```python
import pandas as pd

# Bekanta oss med datasetet!

df = pd.read_csv('data/airbnb_listings_stockholm_detailed.csv')

print("df.shape")
print(df.shape)

print("5 första posterna (df.head()):")
print(df.head())

print("Statistik på alla numeriska kolumneriska kolumner (df.describe):")
print(df.describe())          # statistik på alla numeriska kolumner

print("Hur många observationer per område (df['neighbourhood'])")
print(df['neighbourhood'].value_counts())  # hur många observationer i varje område

print("df.info()")
print(df.info())
```

```
df.shape

Observationer och åtgärder – format och outliers

- Price är en sträng med formatet $123,45.00 – måste konverteras!
- Vi har några extrema outliers på pris, beror på datainmatningsfel. Beslutat att filtrera bort dessa poster med percentilcapping.
- Ett hotel hade registrerat hela sin kapacitet för rum och badrum. Droppade poster med >20 sovrum.
- Vi letar efter tomma poster med df.isna().sum() df.isna().sum()
- Gör Shapiro-testet för att se om pris är normalfördelat. Vid ej normalfördelning, gör priset logaritsmiskt vilket ger normalfördelade residualer som väsentligt förbättrar modellens prestanda.

Datarening och EDA

Observationer och åtgärder - boendestorlek

- Inkonsistent storleksdata. beds, bedrooms och accommodates hängde inte ihop logiskt. Exempel: 1 sovrum och 12 gäster, eller 0 sängar i ett boende. Inga direkt tillgängliga kvadratmeteruppgifter i datasetet.

- Orimliga relationer justerades med logiska gränser: Max 4 gäster per säng. Max 6 gäster per sovrum. Max 6 sängar per sovrum. Imputation.

- accommodates bedömdes mest tillförlitligt som storleksmått

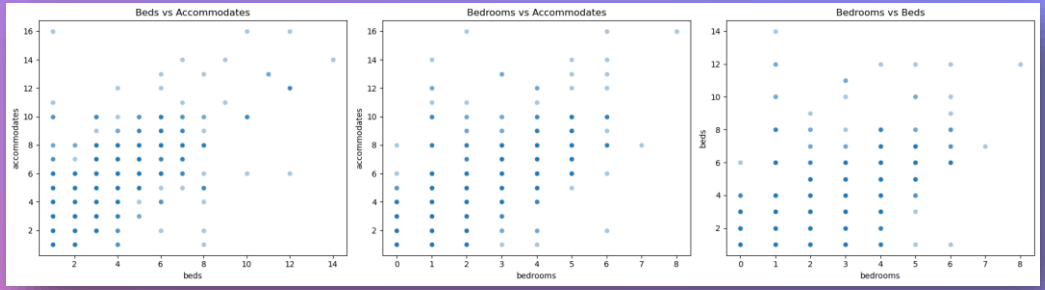
```python
import numpy as np

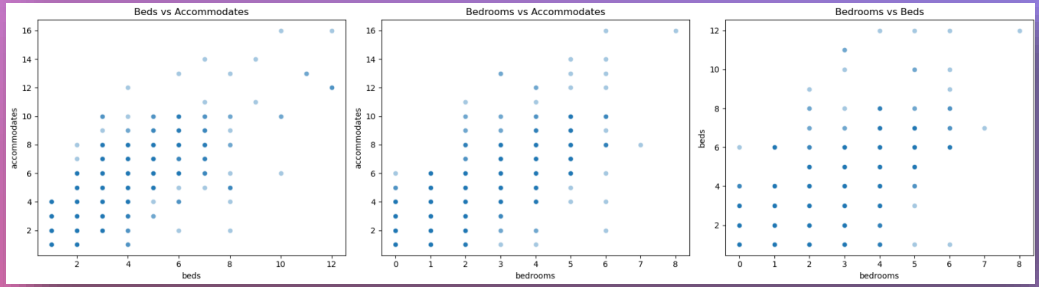
# ersätt 0 för att undvika konstig division / multiplikation
beds_safe = df["beds"].replace(0, 1)
bedrooms_safe = df["bedrooms"].replace(0, 1)

# 1. max 4 gäster per säng
df["accommodates"] = np.where(
    df["accommodates"] > beds_safe * 4,
    beds_safe * 4,
    df["accommodates"]
)

# 2. max 6 gäster per sovrum
df["accommodates"] = np.where(
    df["accommodates"] > bedrooms_safe * 6,
    bedrooms_safe * 6,
    df["accommodates"]
)

# 3. max 6 sängar per sovrum
df["beds"] = np.where(
    df["beds"] > bedrooms_safe * 6,
    bedrooms_safe * 6,
    df["beds"]
)
```





Datarening och EDA

Observationer och åtgärder – shared rooms

- Shared rooms var missvisande.

- Manuell granskning av listningar visade: shared rooms = sängar i sovsalar på vandrarhem
- accommodates beskrev hela sovsalen (t.ex. 14 platser) istället för en bädd
- Ledde till skeva storleks- och prisrelationer.

- Varje rad representerar nu en faktisk bädd, inte hela sovsalen.

```
mask = df["room_type"] == "Shared room"

df.loc[mask, "accommodates"] = 1
df.loc[mask, "beds"] = 1
df.loc[mask, "bedrooms"] = 1
```

Datarening och EDA

Observationer och åtgärder – property group

- property_type-kolumnen hade för många varianter för att vara användbar direkt. Blandade boendetyp och uthyrningsform på ett svåranalyserat sätt.
- Lösningen: förenklad kategorisering med feature engineering.
- Resultat: Fyra tydliga grupper istället för ofantligt många varianter

```

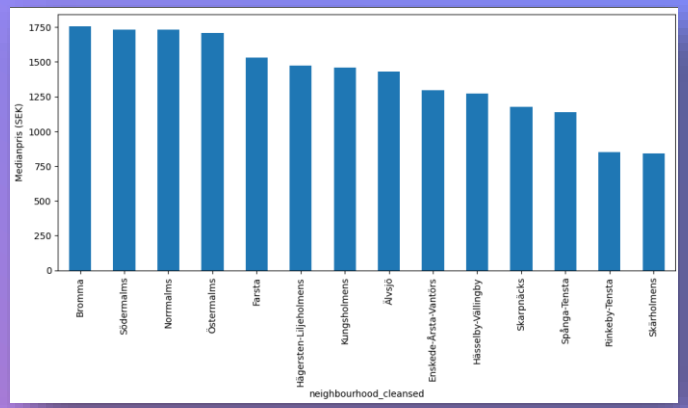
Datarening och EDA

Observationer och åtgärder – dyrt i förorten?

Varför verkade Farsta och Bromma lika dyra som innerstaden?

Boendetypen drog upp medelvärdet.
Farsta innehåller stora villor med pool nära sjöar.
När vi bryter ut boendetyp ser vi att lägenheter i Farsta ligger lågt.
Det är hustypen och inte läget som driver priset uppåt

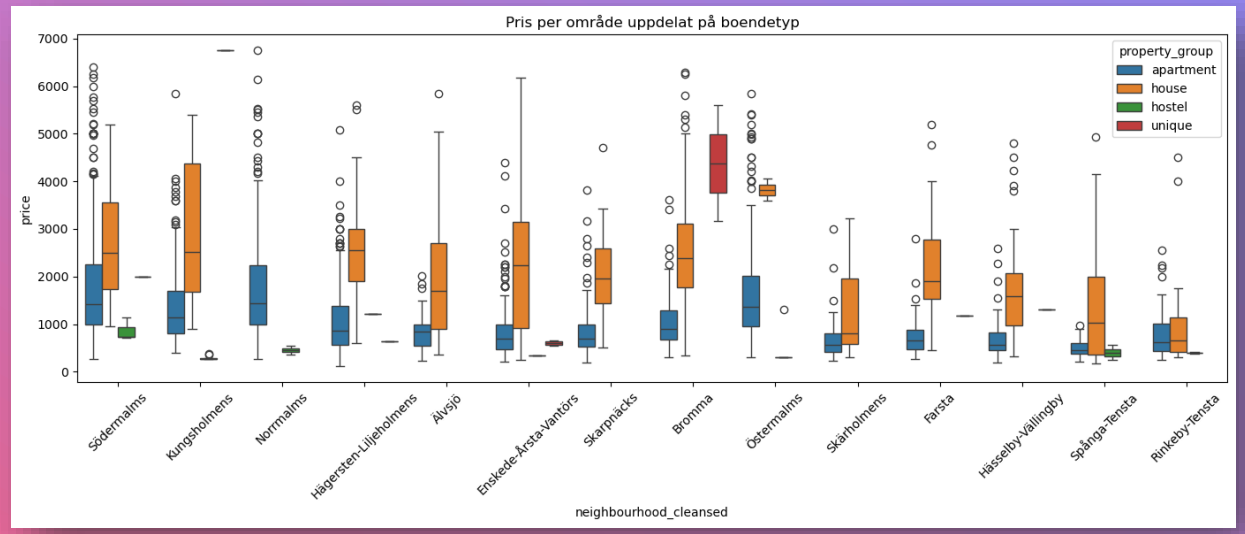
Prisskillnader mellan områden förklaras till stor del av vad som hyrs ut, inte bara var.



```python
plt.figure(figsize=(14, 6))

sns.boxplot(
    data=df,
    x="neighbourhood_cleansed",
    y="price",
    hue="property_group"
)

plt.xticks(rotation=45)
plt.title("Pris per område uppdelat på boendetyp")
plt.tight_layout()
plt.show()
```



Datarening och EDA

One-Hot encoding & Regressionsmodell

Vi konverterar kategoriska variabler av intresse till numeriska med get_dummies så dessa kan hanteras av modellen, och drop_first=True är ofantligt viktigt för att undvika dummy variabel-fälla

Vi byggde fyra OLS-modeller och lade till en variabel i taget:
OLS 1 pris - accommodates
OLS 2+ neighbourhood
OLS 3+ room_type
OLS 4+ property_group

Varje tillägg förbättrade modellen
F-statistika: >150, p ≈ 0 – modellen som helhet är statistiskt signifikant

Nästan alla koefficienter har p < 0.05

```
cleandf = pd.get_dummies(
    cleandf,
    columns=["room_type", "neighbourhood_cleansed", "property_group"],
    drop_first=True
)
```

```
OLS1: Pris ~ accommodates

==============================================================================

Notes:
[1] Standard Errors assume that the covariance matrix of the errors is correctly specified.
[2] The smallest eigenvalue is 6.51e-29. This might indicate that there are
strong multicollinearity problems or that the design matrix is singular.
